Increase

# Prevalence of antihypertensive treatment. South African population 25+.

ExPoSE project preliminary estimates.

1. How much the diffusion of antihypertensive treatment has affected the **distribution of blood pressure** in the South African adult population between 1998 and 2017?
2. What contribution antihypertensive treatment has provided in terms of **averted mortality and morbidity**?

# Methods

Sample size (25+): **110786**

## GAMLSS

$$g_1(\mu) = \eta_1 = X_1\beta_1 + \sum_{j=1}^{J_1} h_{j1}(x_{j1})$$

$$g_2(\sigma) = \eta_2 = X_2\beta_2 + \sum_{j=1}^{J_2} h_{j2}(x_{j2})$$

$$g_3(\nu) = \eta_3 = X_3\beta_3 + \sum_{j=1}^{J_3} h_{j3}(x_{j3})$$

$$g_4(\tau) = \eta_4 = X_4\beta_4 + \sum_{j=1}^{J_4} h_{j4}(x_{j4})$$

## Censored regression

- Among treated, BP in absence of treatment is  $\geq$  measured BP;
- After adjustment for a series of risk factors, the untreated BP distribution among hypertensives is similar to the distribution among healthy subjects

# Results

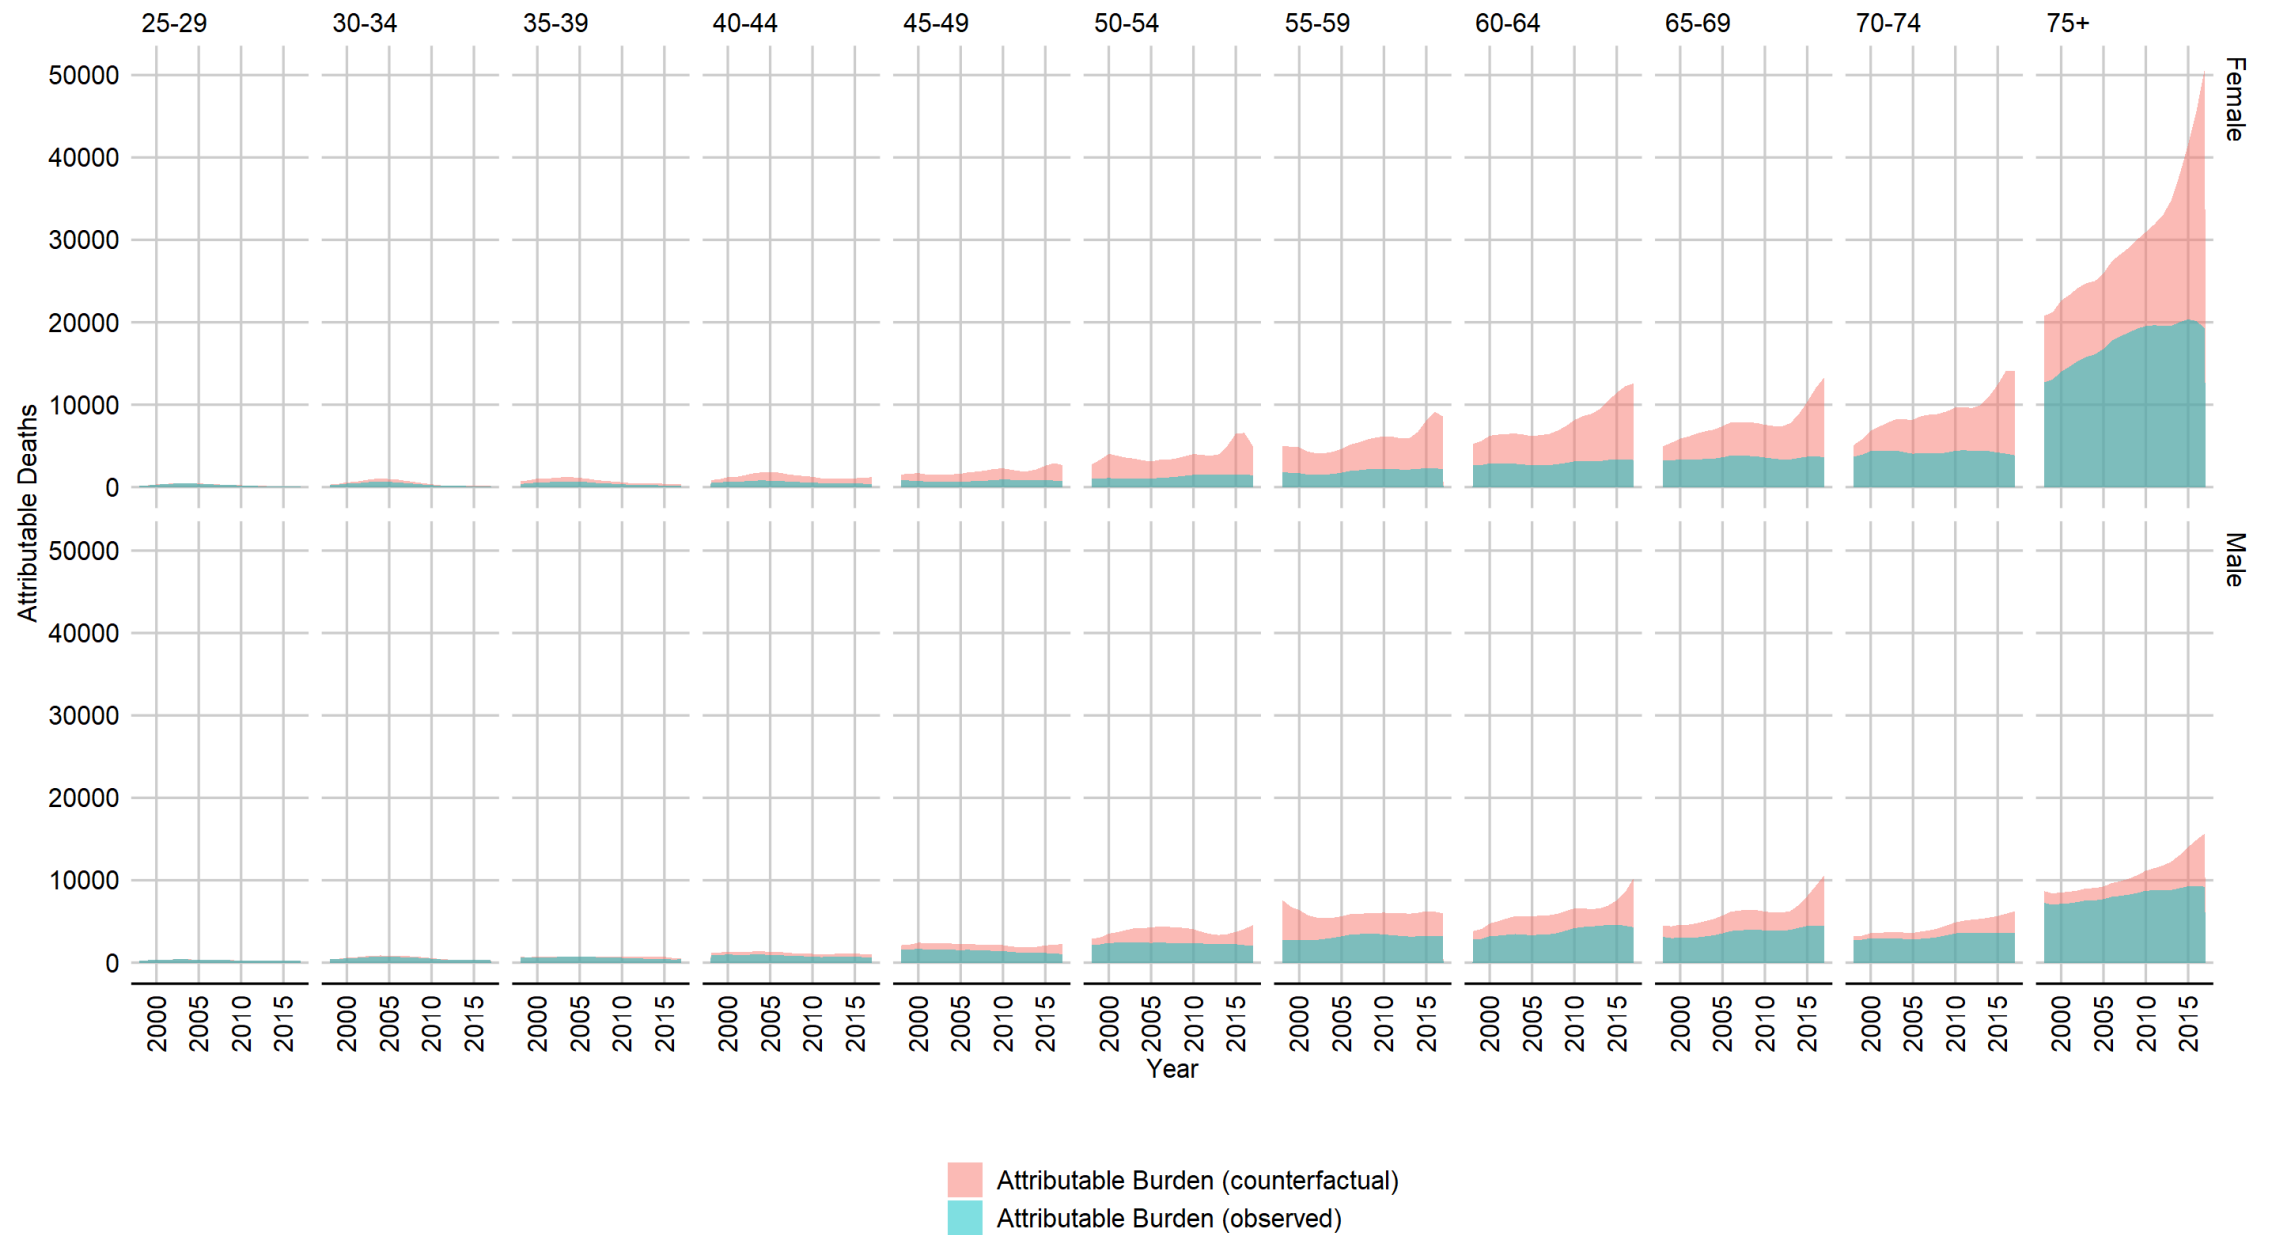

Hypertension cascade. By age and sex.

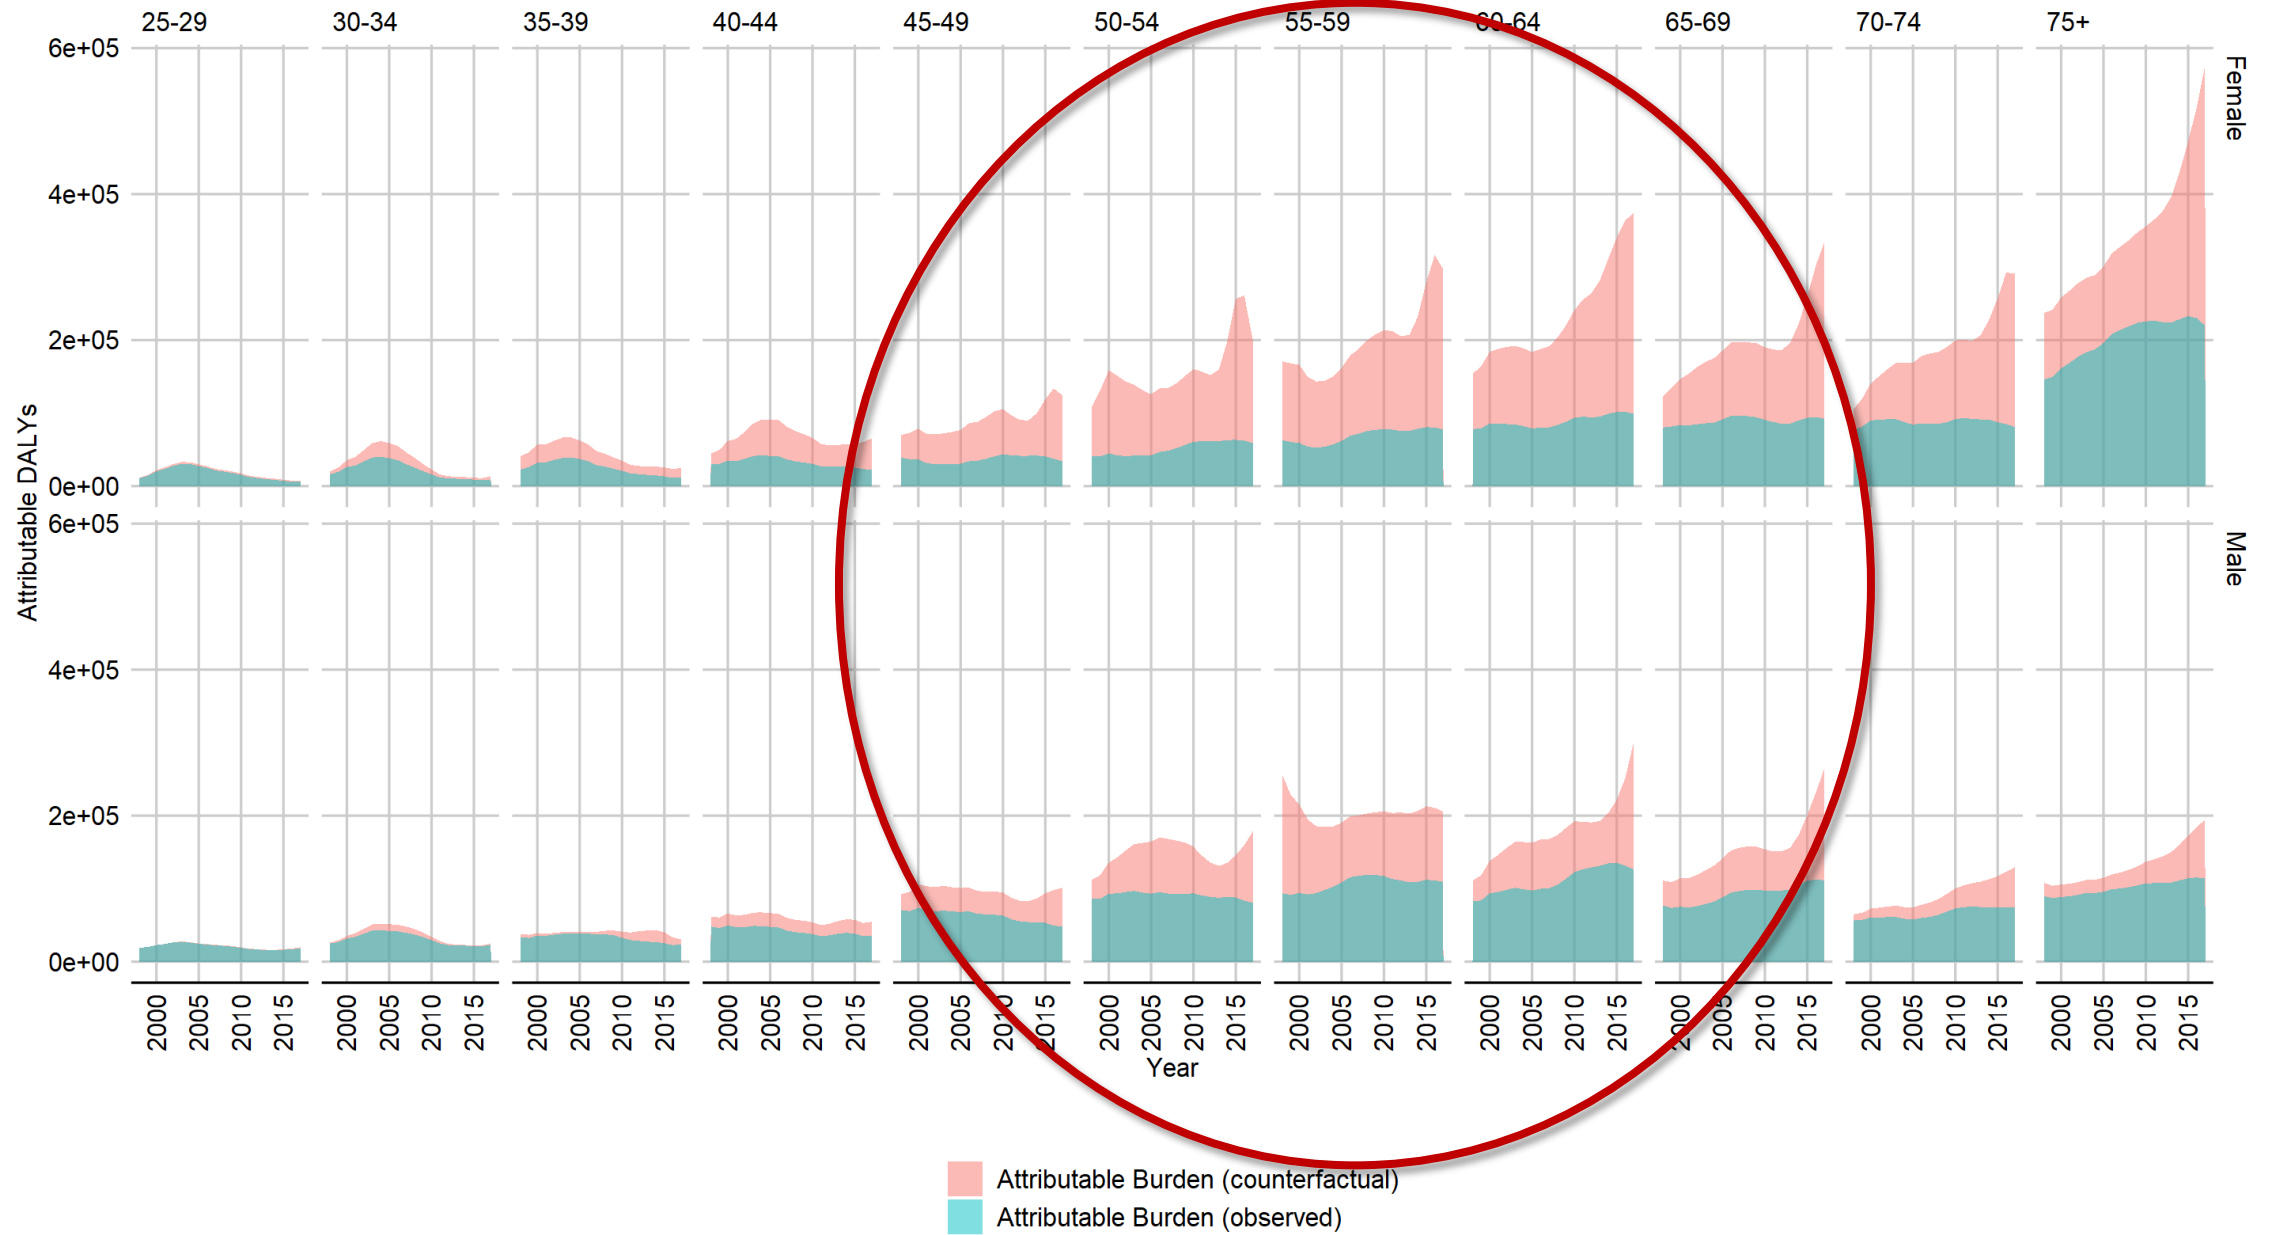

South African population 25+ years, 1998-2017

Observed and counterfactual (in absence of treatment) trends in systolic blood pressure, by sex  
 South African population 25+, 1998-2017

Observed and counterfactual (in absence of treatment) **deaths** attributable to raised blood pressure. By age and sex.  
*South African population 25+ years, 1998-2017*

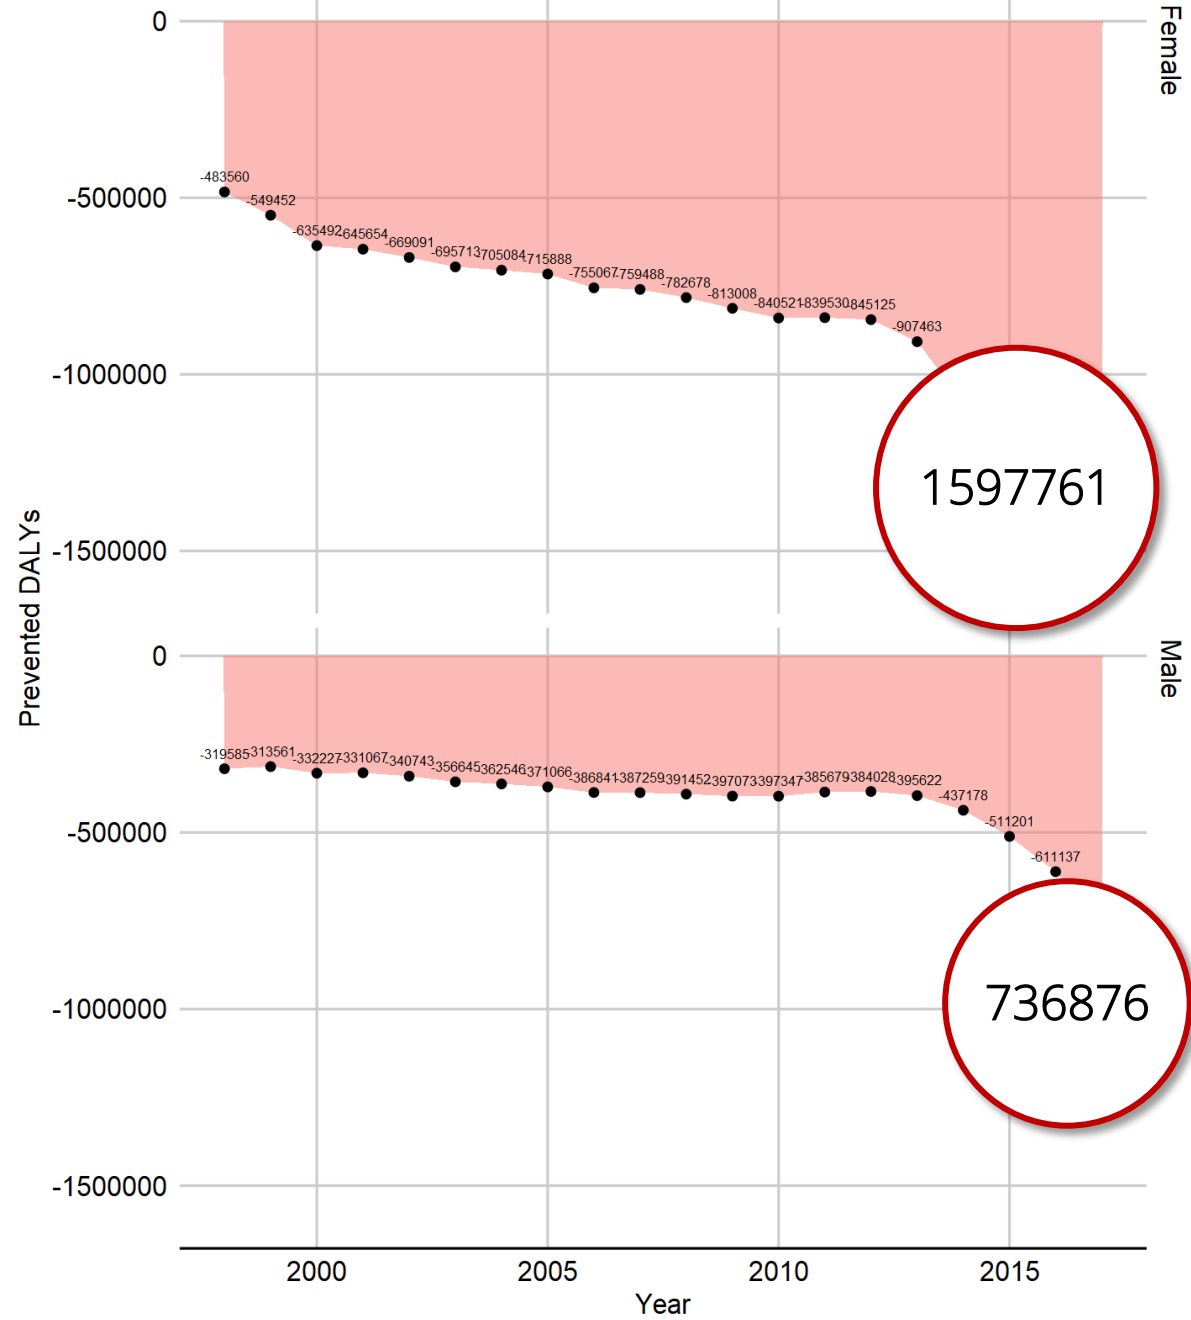

Observed and counterfactual (in absence of treatment) DALYs attributable to raised blood pressure. By age and sex.  
 South African population 25+ years, 1998-2017

South African population 25+ years, 1998-2017

# Conclusions

- In the South African population, antihypertensive treatment is effective in reducing blood pressure by clinically significant amounts, resulting in a shift of the population distribution of public health relevance.
- The increasing diffusion (and, possibly, improved effectiveness) of antihypertensive treatment contributed substantially to the observed decline of average systolic blood pressure in the last decade, and to curb the associated burden in terms of deaths and DALYs.
- Unfavourable trends in major risk factors for hypertension – especially obesity, high blood cholesterol and diabetes -- persist and should be targeted by primary prevention interventions.
- Despite noticeable improvements, levels of awareness and control of hypertension are still largely inadequate, especially among the younger age groups.

# Limitations

- Observational data
- Between-survey differences in sampling strategies, data collection methods, quality
- Self-reported use of medication
- No record of medication type/class
- Assumptions underlying the modelling of counterfactual distributions

# Thank you
